--Abstract

~~The method is for sending messages~~ Messages are sent over secure communication links in networks with a mobile terminal and ~~at least one~~ another terminal. A secure communication link is established between ~~a given~~ an initial network address of the mobile terminal and the address of the other terminal.

10

~~The secure communication link defines at least the addresses of the two terminals. The secure communication link supports an encapsulation method to overcome network address translations and/or other translations.~~ When the mobile

15

terminal moves from ~~on the~~ an initial network address to a new network address, a request message is sent from the mobile terminal to the other terminal to change the secure connection to be used between the new address ~~of the mobile terminal~~ and the other terminal. ~~The request is sent using said method to~~

20

~~overcome network translations.~~ The other terminal responds ~~to the mobile terminal~~ with a reply message with a description about the overcoming methods supported by the other terminal.

25

~~All messages are thereafter sent from the mobile terminal to the other terminal by using the information sent with said~~
~~reply.~~
